

SWIFT reviews. Clear ownership.

A shared workflow for assigning, reviewing and tracing message decisions.

Leadership + future users

Product overview • September 2026

One workflow. Three practical benefits.

A shared view of work connects responsibility, review and follow-up.

For leadership

See work clearly

Stage and owner are visible in the message queue.

For reviewers

Focus on your work

Review actions and assigned messages in one place.

For control teams

Trace the decision

History links actions to people, times and workflow changes.

Expected operating benefits; their scale will be measured during the pilot.

Every message follows a visible path

The workflow records progress from registration to the final review outcome.

“Complete” refers to message review. The application does not demonstrate payment execution.

A shared queue for the team

Find a message, understand its stage and see who owns the next action.

- 1

Find the message

Filter by the fields that matter to the task.
- 2

Read the stage

See progress and current ownership.

Actual interface • Synthetic demonstration data • Access varies by user.

Ownership is explicit at each review stage

An authorised assigner chooses from eligible reviewers; the system checks the rules.

Organisational access

Relevant branch and department

Review permission

Authorised for the required level

Independent reviewer

No earlier approval on this message

Assign message

×

Select the reviewer for message **MSG-00067-JNA05**.

Reviewer

Mateo Silva

Cancel

Assign

Manual assignment • No self-assignment • Reassignment is available before review starts.

Match review depth to the process

Configured workflows support one, two or three required review levels.

One level

Two levels

Three levels

Different reviewers

Each later level needs a different reviewer.

The pilot must confirm the mapping between message types, departments and required review levels.

Review the message. Record the decision.

The reviewer works from My work and sees the message content alongside decision actions.

The screenshot shows a 'Review message' dialog box. At the top, it says 'MSG-00008-ISMFF'. Below that, the message content is displayed in a light gray box: `{1:F01MOCK0000000008}` and `{2:I999MOCK}`. Underneath the content is a text area labeled 'Comment (optional)'. At the bottom right, there are three buttons: 'Approve' (green), 'Reject' (red), and 'Cancel' (gray).

- 1 Open My work**
Find a message assigned to you.
- 2 Inspect the content**
Read the message and add a comment if needed.
- 3 Approve or reject**
Record the decision for the current level.

Actual interface • Synthetic data • Rejection is final in the current implementation.

A decision comes with a traceable history

Authorised users can see who acted, when they acted and how the workflow changed.

- 1

Message registered
The workflow begins.
- 2

Reviewer assigned
Responsibility is recorded.
- 3

Review started
The active reviewer is identified.
- 4

Decision recorded
Outcome and context remain visible.

One recorded decision

Review approved

First review in progress → Waiting for second review

1

Demo: reviewed and ready for the next level.

Illustrative event sequence on the left; actual decision detail with synthetic data on the right.

ORP / Operations Reporting and Processing

08

One workspace. A shared review record.

Source integration, business rules and the user interface have clear responsibilities.

New messages enter through integration. Reviews and audit events stay linked in one application data store.

High-level design for persistent deployment; the screenshots use an in-memory demonstration environment.

A working workflow, with a clear path to pilot

Demonstrated functionality and deployment preparation are separate milestones.

Demonstrated today

- ✓ Team and personal message queues
- ✓ Manual assignment and review decisions
- ✓ One to three review levels
- ✓ Access rules and message audit history

Prepare for the pilot

- 1 Corporate sign-in and approved source access
- 2 Routing, permissions and review-level mapping
- 3 Operating support, recovery and user testing
- 4 Agreed handling of exceptions and waiting work

Automatic assignment, workload balancing and SLA escalation are not part of the demonstrated scope.

Use a focused pilot to measure the difference

Start with an agreed team and message scope, then compare the experience and operating results.

Time to assignment

Median time from registration to first assignment.

Review turnaround

Median time from registration to completion, by workflow.

User experience

Task completion in testing and structured user feedback.

Proposed evaluation measures. Agree the baseline, targets and review date before the pilot starts.

The next step: agree a focused pilot

Give the team a shared process — and validate it with the people who will use it.

01

Name the owner

Business sponsor + representative users

02

Bound the scope

Departments, message types and exceptions

03

Define success

Baseline, targets and a review date

Which team should go first?
